1 Introduction

In the following we will be documenting our process and idea for the final project of the module 326. This document is more about the design and planning instead of our technical implementation.

2 Project Description

Our program has a hierarchical structure. As soon as the User starts the program, he will be choosing his kingdom for which he will be fighting. Either for AK or NM. As soon as the user decides his preferred kingdom different roles will be displayed for the user to choose.

If the user chooses a Democracy, he can choose between following roles:

- King
- Soldier
- Commander
- Citizen
- Minister

Depending on the role, the user will have different responsibilities, as a king the user can only give commands and is in control. He will pass his orders to the Commander if it is related to the military else to the Minister who's responsible for the population.

The Commander executes the order of the king or passes it down to the soldiers. As the head of the army, he can also make decision on its own and train the soldiers. The Minister is in second position with the Commander after the King.

If the user chooses to be a citizen, he will mainly do as the king resp. the minister says and mostly can't disobey him. Though he can still have his own opinion.

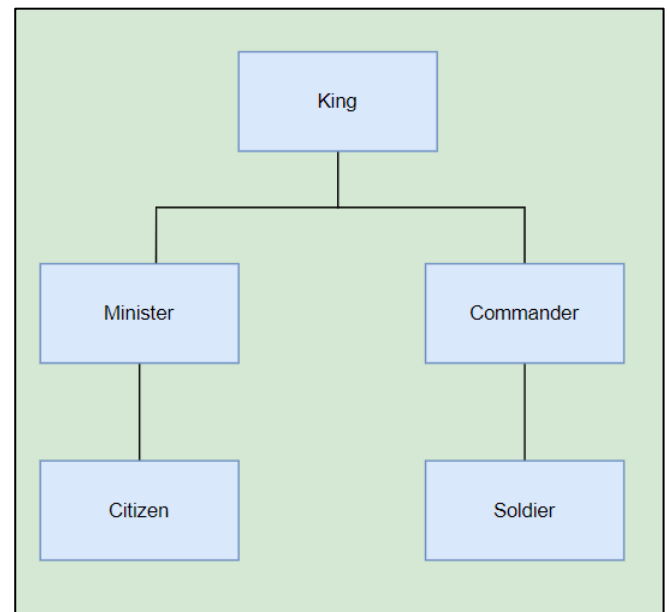

Figure 1 Hierarchy of our player roles

As a soldier there is more fun and action because the user can fight against the enemies and actively choose to:

- Shoot
- Defend

The enemy is from the other kingdom that is played by the system.

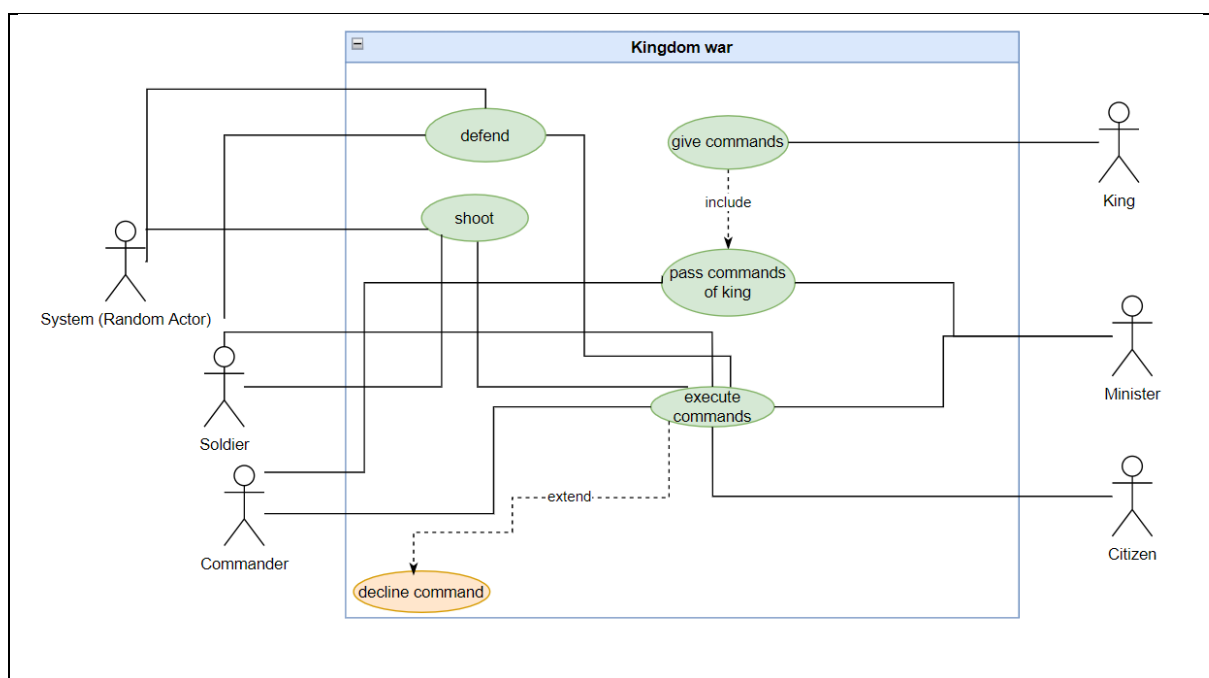

3 Design

Design is a very important step to do before implementing or starting a project. It provides an overview of everything and helps for a better understanding. It is mostly important because the client does not have any technical knowledge. Through the design we visualize his wish.

3.1 Use Case

3.1.1 Use Case Diagram

Use Case Diagram describe the interactions between the system and its actor's meaning users. It shows what the user can do and how to use it, but it doesn't show what happens in the background. It's practical for people with no technical knowledge. Represents how the events flow.

3.1.2 Use Case Description

The Use Case Description describes each interaction the user can do with the system. It explains and shows the exceptions if the user does something inappropriate.

In the following we created Use Case Descriptions for every role of the program...

Use Case #1	User chooses to be a member of the royal family AK
Pre-Condition	The user starts the program and chooses to be a king
Description of Use Case in detail (main scenario)	The user gives the command to mobilize his army
Post-Condition	The commander of the army mobilizes his army, and the get a notification to prepare themselves
Exceptions (what can go wrong, how will the system respond)	The King chooses a command which does not exist in the program → the program lets the king decide his command again

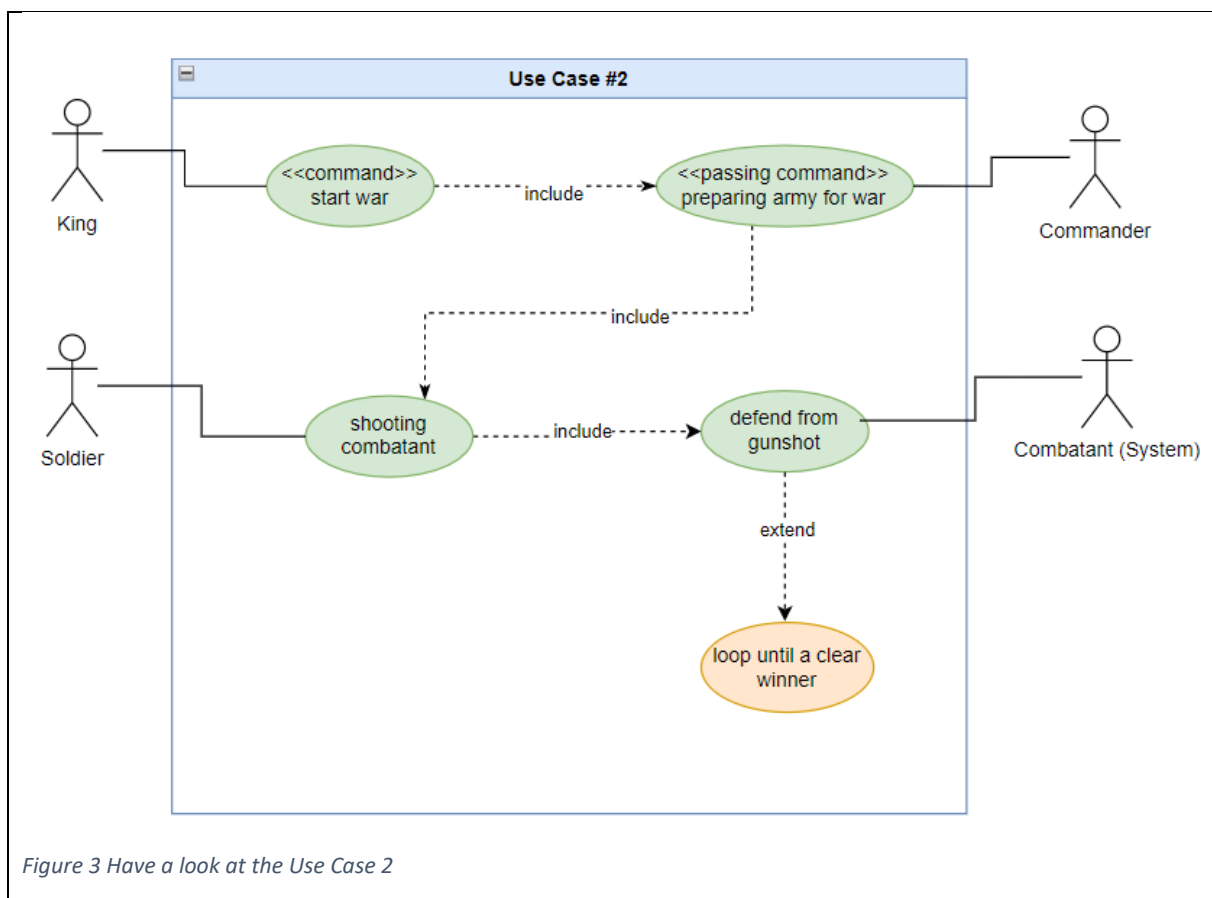

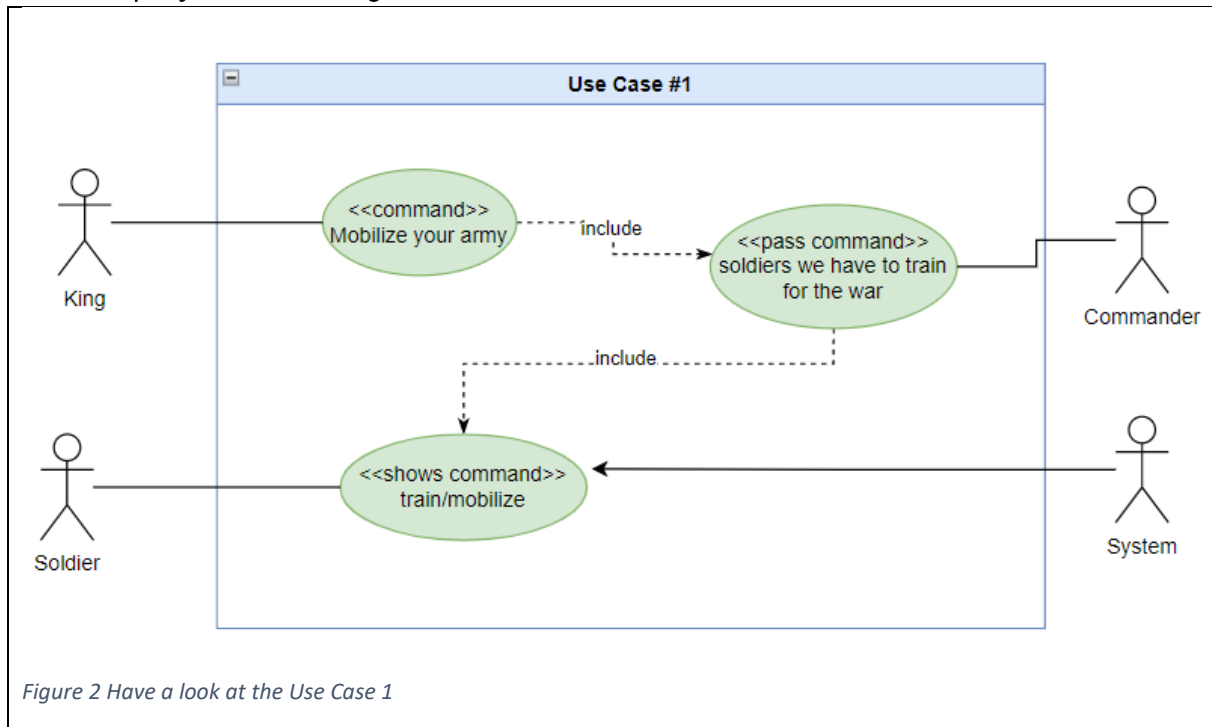

Use Case #2	User chooses to be a soldier from the kingdom NM
Pre-Condition	The user starts the program and picks a task to do
Description of Use Case in detail (main scenario)	After the user picks to fight against a combatant he chooses to shoot him
Post-Condition	The combatant chooses to shield himself from the attack and both soldiers are in a tie
Exceptions (what can go wrong, how will the system respond)	The user picks a move which is not listed so the user gets another chance to pick a valid move

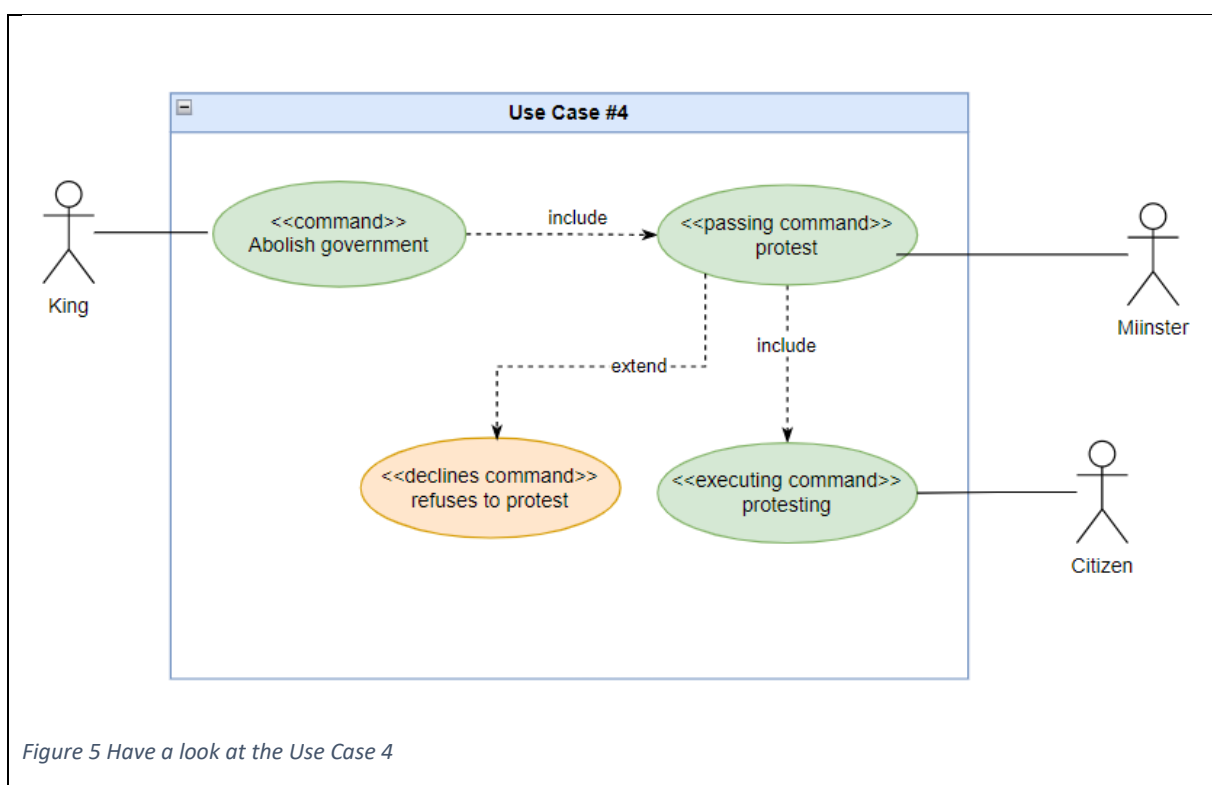

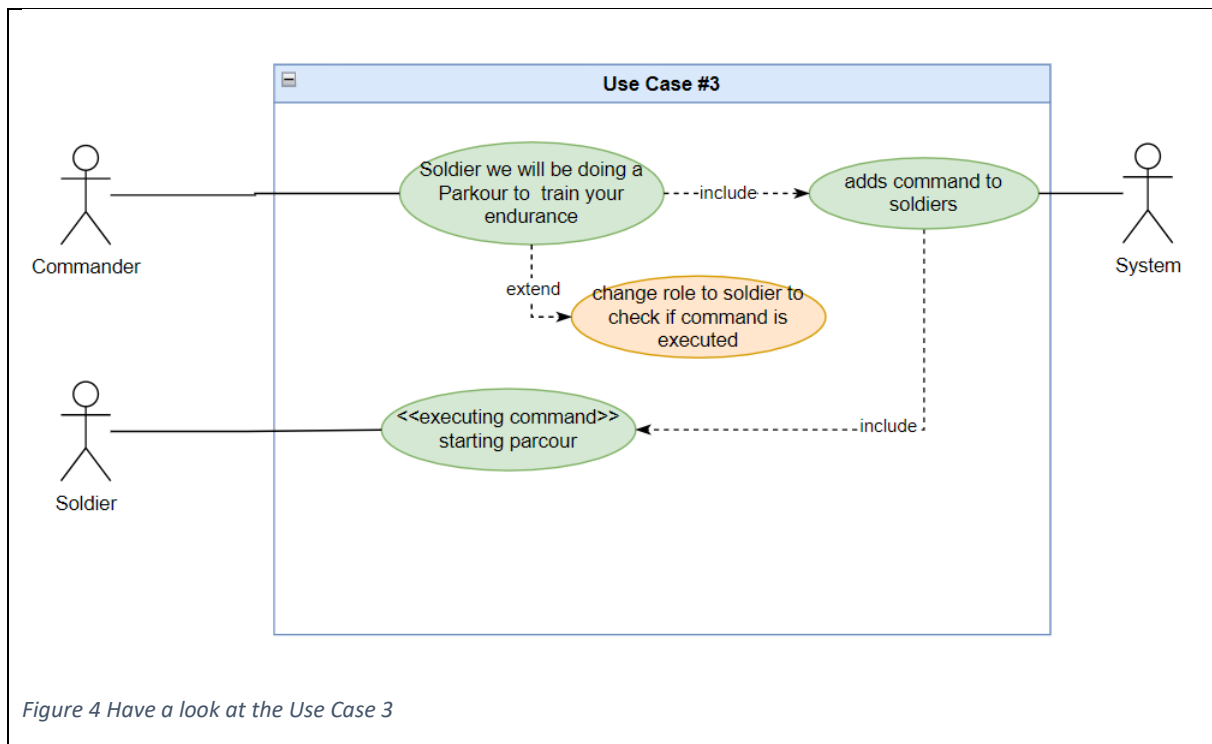

Use Case #3	User chooses to be a general from the kingdom AK
Pre-Condition	The commander is given a menu from which he chooses to create his own operation
Description of Use Case in detail (main scenario)	The commander decides to do a parkour in the field
Post-Condition	Command is passed on. The user can change into the soldier role to check whether the operations are being executed or not
Exceptions (what can go wrong, how will the system respond)	The general chooses an activity which does not exist so that's why he must choose a valid activity

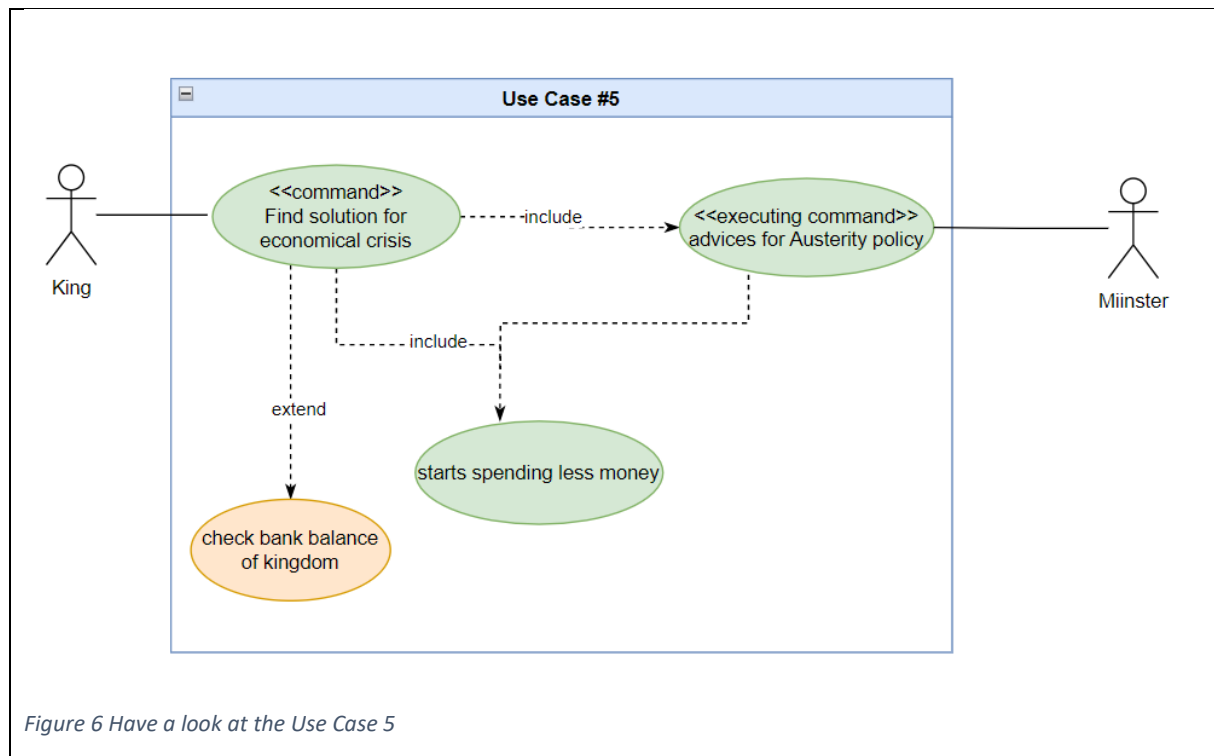

Use Case #4	The user chooses to be a citizen of kingdom NM
Pre-Condition	The user is shown a menu from which he picks to be a citizen
Description of Use Case in detail (main scenario)	As a citizen the user gets the command to protest against the war
Post-Condition	Now the user is given the chance to decline the command or execute it, meaning protesting
Exceptions (what can go wrong, how will the system respond)	If the user chose a task which does not exist, then the user must pick another task

Use Case #5	the user chooses to be the minister of the kingdom AK
Pre-Condition	The user is shown a menu from which he picks to be the minister
Description of Use Case in detail (main scenario)	As the minister the user chooses to advise the royal member and make him spend less money
Post-Condition	The royal member listens to his advice and the user verifies if the royal member has gotten more money
Exceptions (what can go wrong, how will the system respond)	The user chooses a command which does not exist which is why he must pick another command

3.1.2.1 Specific Use Case Diagram

3.2 Improved Designs

In the following we created Use Case Descriptions for the finished code for our project.

Use Case #1	User chooses to be a member of the royal family AK
Pre-Condition	The user starts the program and chooses to be a king
Description of Use Case in detail (main scenario)	The now king gives permission to execute a command
Post-Condition	User chose his role as a king
Exceptions (what can go wrong, how will the system respond)	The King chooses a command which does not exist in the program → the program asks the king again for his command

Use Case #2	User chooses to be a soldier from the kingdom NM
Pre-Condition	The user starts the program and picks a task to do
Description of Use Case in detail (main scenario)	After the user picks to fight against a combatant he chooses to shoot him
Post-Condition	The combatant chooses to shield himself from the attack and both soldiers are in a tie
Exceptions (what can go wrong, how will the system respond)	The user picks a move which is not listed so the user gets another chance to pick a valid move

Use Case #3	User chooses to be a general from the kingdom AK
Pre-Condition	The commander is given a menu from which he chooses to create his own operation
Description of Use Case in detail (main scenario)	The commander decides to do a parkour in the field
Post-Condition	Command is passed on. The user can change into the soldier role to check whether the operations are being executed or not
Exceptions (what can go wrong, how will the system respond)	The general chooses an activity which does not exist so that's why he must choose a valid activity

Use Case #4	The user chooses to be a citizen of kingdom NM
Pre-Condition	The user is shown a menu from which he picks to be a citizen
Description of Use Case in detail (main scenario)	As a citizen the user gets the command to protest against the war
Post-Condition	Now the user is given the chance to decline the command or execute it, meaning protesting
Exceptions (what can go wrong, how will the system respond)	If the user chose a task which does not exist, then the user must pick another task

Use Case #5	The user chooses to be the minister of the kingdom AK
Pre-Condition	The user is shown a menu from which he picks to be the minister
Description of Use Case in detail (main scenario)	As the minister the user chooses to check for any notifications
Post-Condition	The king gave the instruction to collect taxes
Exceptions (what can go wrong, how will the system respond)	The user chooses a command which does not exist which is why he must pick another command

4 Planning

As soon as the design is complete, we move on to the planning process. For the planning we create CRC-card (Class Responsibility Collaboration Card) and a class diagram derived from the domain model and the CRD-Cards.

4.1 CRC-Card

With the help of CRC-Cards we could share our thoughts and combine them to one. It was now easier to think about the responsibilities of each class.

King		RequestHandler
<ul style="list-style-type: none"> • Give highest commands • Take advice • Check bank balance of kingdom 		<ul style="list-style-type: none"> • Instruction • RequestHandler

Commander		RequestHandler
<ul style="list-style-type: none"> • passes commands of king to his soldiers • as the head of the army, he can make decisions on his own 		<ul style="list-style-type: none"> • Instruction • Notification • RequestHandler

Minister		RequestHandler
<ul style="list-style-type: none"> • give Instructions • passes commands of king to population 		<ul style="list-style-type: none"> • Instructions • RequestHandler • Notification

Soldier		RequestHandler
<ul style="list-style-type: none"> • fight (shoot, defend) • execute commands of commander / general • collect points for kingdom by winning a fight 		<ul style="list-style-type: none"> • Instruction • Notification • RandomMove • RequestHandler

Notification	
<ul style="list-style-type: none"> • notify user depending on which role he has 	<ul style="list-style-type: none"> • Queue • Commander • Soldier • Citizen • Minister

Instruction	
<ul style="list-style-type: none"> • all commands for the user 	<ul style="list-style-type: none"> • Minister • Soldier • Commander • King • Citizen • Queue

Validation	
<ul style="list-style-type: none"> • Validate string input • Validate number input • Validate use case input 	<ul style="list-style-type: none"> • IO-Handler

Organizer	
<ul style="list-style-type: none"> • combines all the functionality 	<ul style="list-style-type: none"> • IO-Handler • Starter

IO-Handler	
<ul style="list-style-type: none"> • menus • takes input from user • prints all informations 	<ul style="list-style-type: none"> • Organizer • Validation • Instruction

Starter	
<ul style="list-style-type: none"> • run method 	<ul style="list-style-type: none"> • Organizer

Queue	
<ul style="list-style-type: none"> • Solving threads • Waits until prior command has been executed 	<ul style="list-style-type: none"> • RequestHandler • IO-Handler • Notification • Instruction

RandomMove	
<ul style="list-style-type: none">prints out a random generated move as the combatant of the soldier	<ul style="list-style-type: none">SoldierInstruction

RequestHandler	
<ul style="list-style-type: none">takes care that the commands are passed (design pattern: chain of responsibility)	<ul style="list-style-type: none">QueueKingCommanderMinisterSoldierCitizenInstruction

4.2 Improved CRC-Cards

In the following, you can see our improved CRC-Cards and how we implemented the project.

Abstract <div>RequestHandler</div> Citizen, Minister, Commander, Soldier	
<ul style="list-style-type: none"> • handle Request method, passes on the commands from person to person • check Notification method 	

RandomMove	
<ul style="list-style-type: none"> • get Computer Move, generates randomly fighting moves against the user 	<ul style="list-style-type: none"> • Soldier

Instruction	
<ul style="list-style-type: none"> • instruction consists of a command and it's description • marks the instruction as handled as soon as it's forwarded 	<ul style="list-style-type: none"> • Soldier • IOHandler • King • Minister • Citizen • Commander

Starter	
<ul style="list-style-type: none"> • run method 	<ul style="list-style-type: none"> • Organizer

Minister <div>RequestHandler</div>	
<ul style="list-style-type: none"> • passes commands of king to population • daily quotes for king as motivation 	<ul style="list-style-type: none"> • IO-Handler • King

Organizer	
<ul style="list-style-type: none"> combines all the functionality 	<ul style="list-style-type: none"> IO-Handler Starter

Validation	
<ul style="list-style-type: none"> validates string input validates int input 	<ul style="list-style-type: none"> IOHandler

Soldier		RequestHandler
<ul style="list-style-type: none"> handle Request collecting money for kingdom by fighting the enemy 	<ul style="list-style-type: none"> King IOHandler 	

IOHandler	
<ul style="list-style-type: none"> has all menus takes user input prints all the informations 	<ul style="list-style-type: none"> Organizer Validation Instruction Different Roles

King	
<ul style="list-style-type: none"> Give instructios - make request check bank balance of kingdom check amount of army man 	<ul style="list-style-type: none"> IO-Handler Soldier

4.3 Domain Model

In the following we created a domain model to visualize our thoughts and decided entities as well as how they are associated with each other.

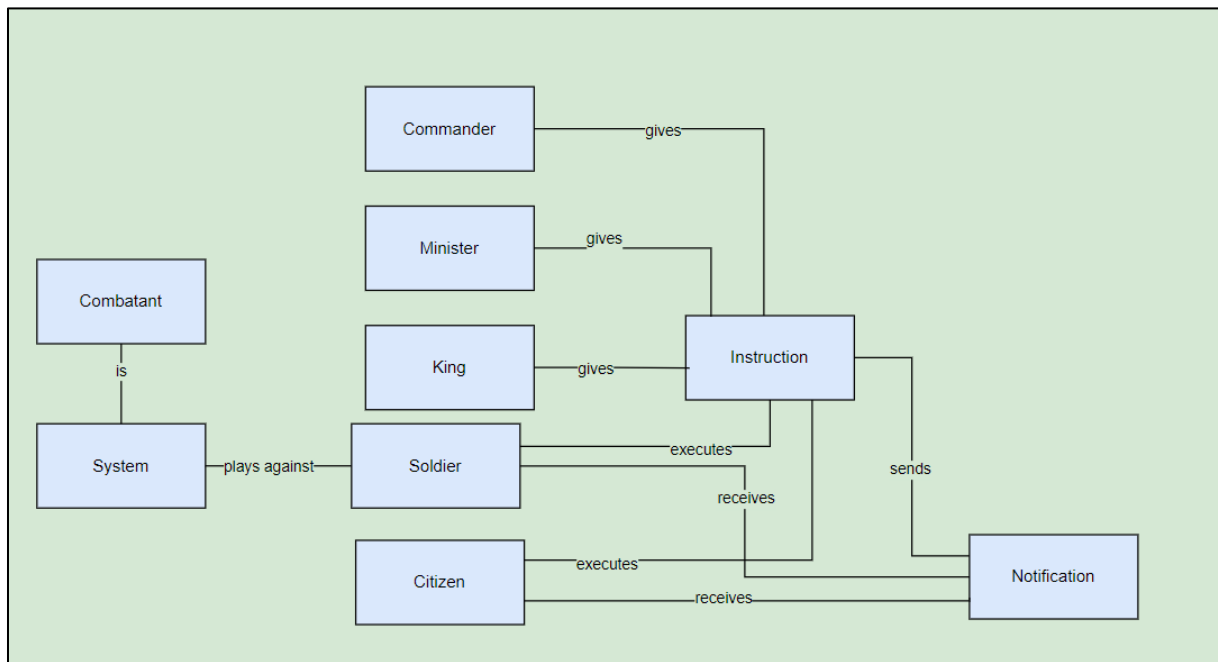

Figure 7 Look at Project Description for details

4.4 Class Diagram

The class diagram is the basic structure for our project which we have derived from the domain model and the CRC cards. Because of this we now have collected all the possible attributes and methods, so that the practical implementation is structured.

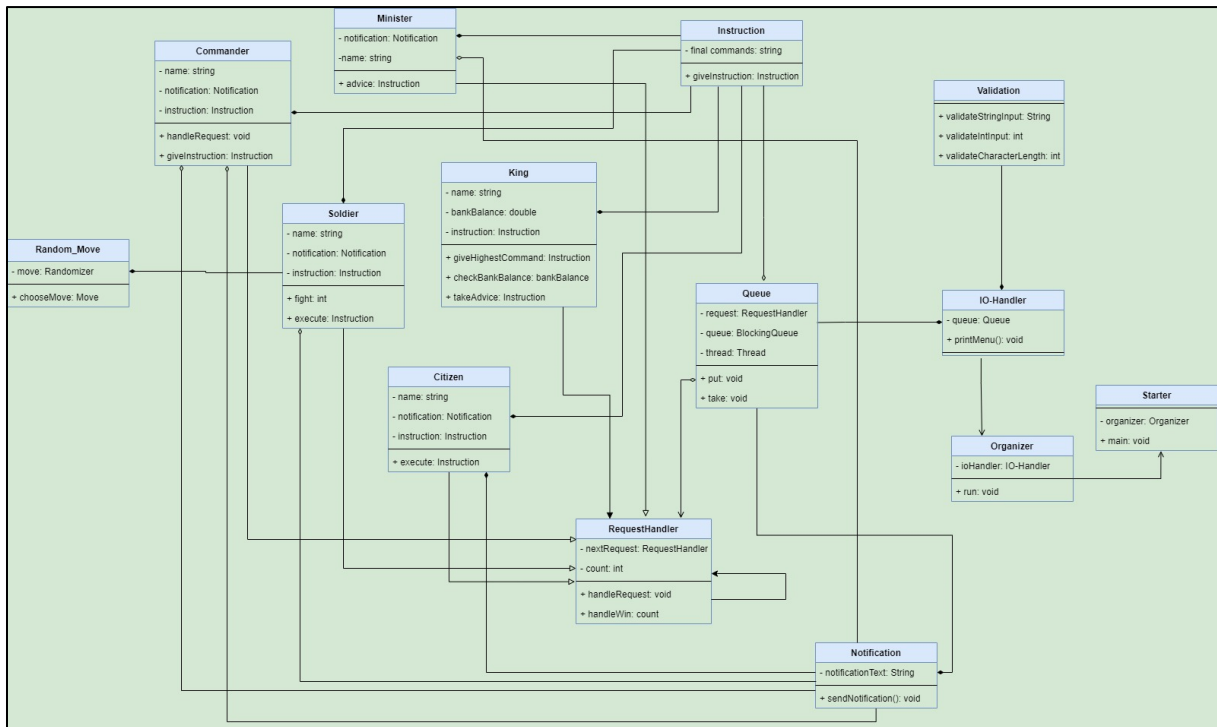

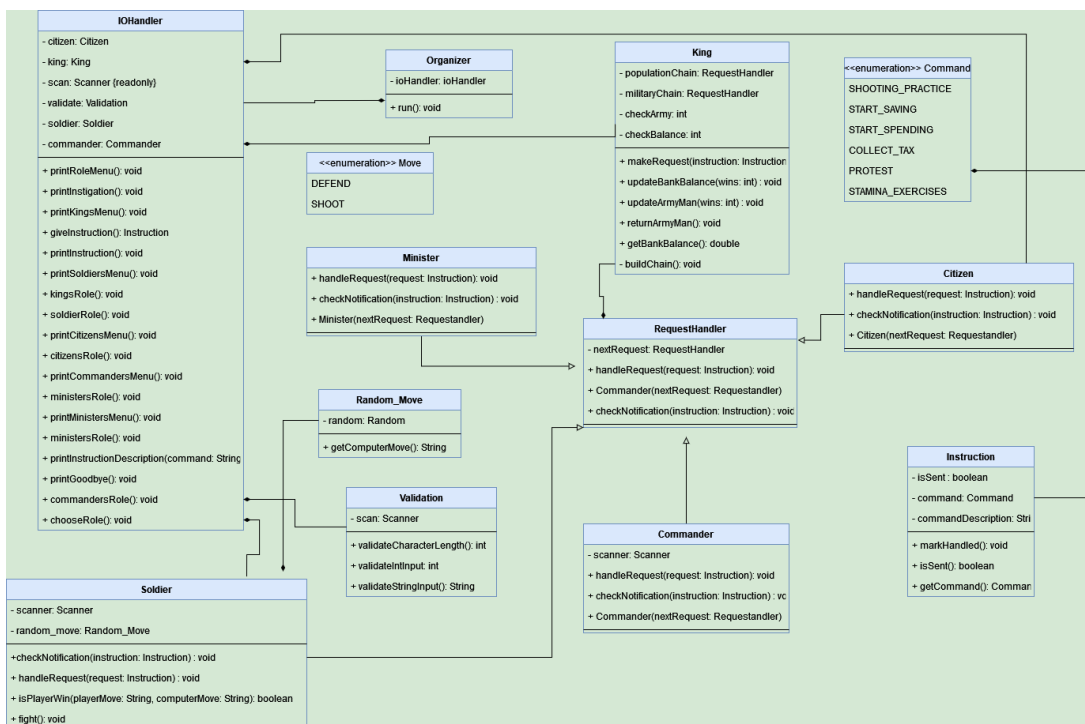

Figure 8 Class Diagram

4.5 Improved Class Diagram

This is our improved class diagram. As you can see from the above we removed some classes because we found a better idea on how to combine things.

5 Testing

In the following we will test our software with different cases to ensure the quality of the war zone game.

5.1 True positive

The expected result corresponds to the expectations.

Test Case Nr.	Input	Expected Output	Received Output	Comment
1 – Chooses Kingdom	1	Historical background of kingdom	Historical background of kingdom	Ok
2 – Choosing role	2	Menu of soldier appears	Menu of soldier appears	Ok
3 – Start Fight as Soldier	1	War Zone introduction to fight	War Zone introduction to fight	Ok
4 – fight with enemy	defend	Enemy corresponds if shoot then I get points	Enemy corresponds with “shoot”, I won this round and got points	Ok
5 – users choose next move for fight, randomizer corresponds	shoot	Randomizer (Enemy) corresponds	Enemy corresponds with: “defend”	Ok
6 – Go back to main menu	3	Main menu – choose Role is shown	Main menu – choose Role is shown	Ok
7 – Exit Program	6	Goodbye message	Goodbye message	Ok

5.2 True negative

Expected result does not match the result

Test Case Nr.	Input	Expected Output	Received Output	Comment
1 – choosing from main menu	8	Invalid answer, try again	Invalid answer, try again	Ok
2 – King instruction	3, WALK	Exception does not exist in list of commands	IllegalArgumentException received	Ok

5.3 False positive

When testing error cases, it corresponds to according to the expectation.

Test Case Nr.	Input	Expected Output	Received Output	Comment
1 – choosing Role	7	Exception, answer is not valid user should try again	Exception, answer is not valid user should try again	Ok
2 - User enters not valid fight move	Throw toxic acid	Exception: Move isn't valid, try again	Exception: Move isn't valid, try again	Ok
3 – king gives Instruction	3, START_SPENDING	Instruction is passed to the citizens	Citizens get Instruction from King	Ok
4 – user is in menu of commander	4, 3, 5	Exception for invalid input, continuously asks for user input until satisfied with answer	Exception for invalid input, continuously asks for user input until satisfied with answer	Ok

5.4 False negative

Program does not respond according to the expectation.

Test Case Nr.	Input	Expected Output	Received Output	Comment
1 – Kings menu giving Instruction	GIVE_UP	Exception No such command found, try again → choose from list	IllegalArgumentException	Not ok
